

# FileCopier Quick Start Guide

FileCopier lets you copy files selectively with fine-grained filters, then apply the result to a destination folder, one or more targets at once, or export a report.

## **\*\*1. Choose a source folder\*\***

Click \*Source → Browse...\*, pick the root folder to scan, then click **\*\*Load tree\*\***. FileCopier reads the folder structure (no files are copied yet).

Main window after loading a source tree

## **\*\*2. Filter what to copy\*\***

Click **\*\*Filter\*\*** to open the filter dialog. Build rules (by name, extension, size, date, path). Free edition allows up to 2 rules; Pro removes the limit. Click **\*\*Apply\*\*** — matching files are listed in the \*Preview\*.

**\*\*3. Preview and confirm\*\***

The Preview dialog shows every matched file. Uncheck anything you want to skip, then **\*\*Apply to main tree\*\***. If a destination already contains a file with the same name, the **\*Conflicts\*** dialog tells you whether to overwrite, skip, or auto-rename.

*Conflict dialog — resolve existing files at the destination*

**\*\*4. Pick destination(s) and copy\*\***

Enter a destination (or several), choose collision handling, then **\*\*Copy\*\***. A progress dialog reports speed and a summary shows how many files/folders were copied, skipped, or conflicted.

**\*\*5. About Pro\*\***

Pro (USD 10, lifetime, per device) removes the 100-file free limit, the 2-rule filter cap, and unlocks multi-destination copy. To activate, buy via the contact below and enter the PC code + received license key in **\*\*Help → Activate Pro...\*\***.
